1. This little _____ is known to researchers as Gyra. She's tiny, _____ a mere two pounds - 200 times less than a ____. She'd be almost impossible to find, but she's being _____ with a radio collar. And using surveillance cameras that _____ cat's night-vision, we can, at last, reveal her nocturnal _____. She can walk 20 miles a night in search of food, the farthest recorded for any small cat. Guided by _____ night vision and responding to the smallest of sounds, she finds almost anything that moves is a _____ meal. She'll even eat _____, but she prefers _____. Or if that doesn't work - birds! With a _____ to tuck her legs in, she gets as low to the _____ as possible. Primed like a spring, she can deliver maximum power to ____. She hits her target 60 percent of the time. It's what makes black-footed cats the _____ hunters in the entire cat family.

Transcript

This little female is known to researchers as Gyra. She's tiny, weighing a mere two pounds - 200 times less than a lion. She'd be almost impossible to find, but she's being tracked with a radio collar. And using surveillance cameras that rival a cat's night-vision, we can, at last, reveal her nocturnal pursuits.

She can walk 20 miles a night in search of food, the farthest recorded for any small cat. Guided by superb night vision and responding to the smallest of sounds, she finds almost anything that moves is a potential meal. She'll even eat locusts, but she prefers gerbils. Or if that doesn't work - birds!

With a wiggle to tuck her legs in, she gets as low to the ground as possible. Primed like a spring, she can deliver maximum power to jump. She hits her target 60 percent of the time. It's what makes black-footed cats the most lethal hunters in the entire cat family.
